

# WHAT COMES NEXT

*(number the stages in their correct order)*

- 1 Starting with a seed
- Flower – the plant grows flower buds which open
- Dispersal – the seed is taken away by wind, birds or other animals
- Photosynthesis – the plant uses water, carbon dioxide and energy from the sun to grow bigger
- Dormancy – the seed rests until the best time to grow
- Seedling – the seed grows its first leaves
- Fertilisation – the flower is pollinated and a seed forms
- Germination – the seed begins to grow
- 9 Ending with fruit and seeds. When the seeds are ready the cycle starts over again.

***Draw a big circle diagram or a comic strip of pictures to show the stages in the life of a plant in their correct order.***
